# COVID-19 Global Impact Dashboard

## Executive Summary | VEDA Technology Data Analyst Internship

**Purpose.** Explore reported COVID-19 cases, deaths, and vaccination progress across countries using an end-to-end analytics workflow.

**Data source.** Our World in Data COVID-19 dataset. The notebook downloads the source and records the exact date range and row counts at run time.

**Methods.** Data-quality profiling, date parsing, duplicate location-date handling, 7-day rolling averages, case-fatality ratio, per-million comparisons, and visual analysis.

**Deliverables.** Reproducible Jupyter notebook, cleaned CSV export, interactive Streamlit dashboard, trend charts, quality checklist, and detailed report.

## Results to finalize after running the notebook

1. Dataset row count and date range: copy from outputs/data_quality_summary.csv.
2. Three evidence-backed insights: use outputs/selected_country_kpis.csv and the generated charts.
3. Country comparison caveat: reported values depend on testing, definitions, reporting delays, and data availability.

**Interpretation note.** This is descriptive educational analysis. The charts do not prove that one intervention caused a change in cases or deaths.
